

Miscellaneous Products

It was our intention to leave out all marginal products from this new publication. However, there are two products that should be brought to the attention of the reader, namely Bi-O-Spray and HydrOikos. Both do very well in certain markets, while being virtually unknown in others. Both are of importance to the biological farmer.

Bi-O-Spray

Bi-O-Spray is a very useful adjuvant that permits the faster and more complete foliar absorption of nutrients and agrichemicals applied in conjunction. For instance, it has been shown that the application rates of certain herbicides (including glyphosate) can be reduced by over 30% when combined with Bi-O-Spray.

Bi-O-Spray contains soluble fulvic acids in combination with an exclusive ethoxylated compound that acts as a foliar penetrant.

The normal application rate is from 500 ml to 1 liter of Bi-O-Spray, combined with the foliar substances to be applied (and the application rate of which can usually be reduced by at least 30%) per hectare.

HydrOikos

HydrOikos regulates the availability of water in the soil, draining the excess but retaining a reservoir of humidity at the root level. The product is particularly useful when applied before the end of the rainy season, thus permitting the retention of a reservoir of water in the soil.

The normal application rate is 1 to 1.5 liters per hectare.
